The Python-Fitz Documentation

Introduction

python-fitz is a Python binding for MuPDF - "a lightweight PDF and XPS viewer".

MuPDF can access files in PDF, XPS, OpenXPS and EPUB (e-book) formats.

These are files with extensions *.pdf, *.xps, *.oxps or *.epub (so in essence, with this binding you can develop e-book viewers in Python ...)

python-fitz provides access to all important functions of MuPDF from within a Python environment. Nevertheless, this function set is continuously being increased.

MuPDF stands out among all similar products for its top rendering capability and unsurpassed processing speed.

You can check this out yourself: Compare the various free PDF-viewers. In terms of speed and rendering quality SumatraPDF ranges at the top - and it is based on MuPDF!

While python-fitz has been available since several years for an earlier version of MuPDF (1.2), it was until only recently (mid May 2015), that its creator and a few co-workers decided to elevate it to the current release 1.7a of MuPDF.

And we are determined to keep python-fitz current with future MuPDF changes!

This work is almost completed: we are now mainly working to bring the documentation up to date.

If you know how to build MuPDF on your platform (or you could use our development binaries - just drop a note), then you can use this repository to **make PDF**, **XPS**, **OpenXPS** and **EPUB** available to your Python scripts already **today** - everything works!

python-fitz has been tested and can be used today on Linux, Windows 7, Python 2 and Python 3.

So, what do we have?

- We have ready and working installation procedures for Linux and Windows.
- We have example and demo scripts for typical use cases that you can take as templates for your development.
- We have greatly simplified the installation procedure for Windows x86 and Linux platforms.

So, what is still missing then?

- New documentation is almost complete you are looking at the result. Do also have a look at the demos and examples provided.
- Some tests are still outstanding, e.g. for the combination Win & Python 3.

We invite you to join our efforts by contributing to the the wiki pages, by testing what is there - and, of course, by submitting issues and bugs to the site!

Installation

This describes how to install python-fitz.

Step 1: Download python-fitz

Download this repository and unzip it. This will give you a folder, let us call it PyFitz.

Step 2: Download MuPDF 1.7a

Download MuPDF version 1.7a source, and unzip it. Let us call the resulting folder mupdf17.

Put it inside PyFitz as a subdirectory, if you want to keep everything in one place.

Step 3: Build / Setup python-fitz

If necessary, adjust the setup.py script now. E.g. make sure that

• the include directory is correctly set in sync with your directory structure

It is no longer necessary to generate MuPDF object code if your platform is either Windows (32 Bit) or Linux. The required object libraries for these two platforms have been put into respective directories, and the setup script has been updated. These are the names of those directories:

- LibLinux for the Linux-generated MuPDF libraries
- LibWin32 for the Windows-generated MuPDF libraries

Now perform a python setup.py install

Tutorial

This tutorial will show you the use of MuPDF in Python step by step.

Because MuPDF supports not only PDF, but also XPS, OpenXPS and EPUB formats, so does python-fitz. Nevertheless we will only talk about PDF's for the sake of brevity.

Import the Bindings

The Python bindings to MuPDF are made available by this import statement:

import fitz

Open a Document

In order to access a supported document, it must be opened with the following statement:

doc = fitz.Document(filename)

This will create doc as a *Document* object. filename must be a Python string or unicode object that specifies the name of an existing file (with or without a fully or partially qualified path). A *Document* contains several attributes and functions. Among them are meta information (like "author" or "subject"), number of total pages, outline and encryption information.

Some Document methods and attributes

Method / Attribute	Description
Document.pageCount	Number of pages of filename (integer).
Document.metadata	Metadata of the Document (dictionary).
Document.outline	First outline entry of Document
Document.ToC()	Table of contents of Document (list).
Document.loadPage()	Create a Page object.

Access Meta Data

Document.metadata is a Python dictionary with the following keys. For details of their meanings and formats consult the PDF manuals. The meta data fields are of type string if not otherwise indicated and may be missing, in which case they contain None.

Key	Value
producer	Producer (producing software)
format	PDF format, e.g. 'PDF 1.4'
encryption	Encryption method used
author	Author
modDate	Date of last modification
keywords	Keywords (dictionary)
title	Title

creationDate	Date of creation
creator	Creating application
subject	Subject

Work with Outlines

Entering the documents outline tree works like this:

```
olItem = doc.outline  # the document's first outline item
```

This creates olltem as an Outline object.

Some Outline methods and attributes

Method / Attribute	Description
Outline.saveText()	Save table of contents as a text file
Outline.saveXML()	Save table of contents as a quasi-XML file
Outline.next	Next item of the same level
Outline.down	Next item one level down
Outline.title	Title of this item (UTF-8)
Outline.dest	Destination ('where does this entry point to?')

Some Outline.dest attributes

Attribute	Description
Outline.dest.page	Target page number
Outline.dest.lt	Top-left corner of target rectangle
Outline.dest.rb	Bottem-right corner of target rectangle

MuPDF also supports outline destinations to other files and to URIs. See Outline.

In order to get a document's table of contents as a Python list, use the following function:

```
toc = doc.ToC() # [[level, title, page], ...], or []
```

Work with Pages

Tasks that can be performed with a *Page* are at the core of MuPDF's functionality. Among other things, you can render a *Page*, optionally zooming, rotating or shearing it. You can write it's image to files (in PNG format), extract text from it or perform searches for text elements. At first, a page object must be created:

```
page = doc.loadPage(n)  # represents page n of the document
```

Here are some typical uses of *Page* objects:

Inspect the links on a Page

Here is an example that displays all links and their types:

```
#-----
# Get all links of the current page
#-----
```

Render a Page

This example creates an image out a page's content:

Save the page image in a file

We can simply store the image in a PNG file:

```
pix.writePNG("test.png")
```

Use the image in a dialog manager

Or we convert the image into a bitmap usable by a dialog manager:

Extract and search for text of a Page

We can also extract all text of a page in a big chunk of string:

```
# Includes all whitespace (tabulation, end-of-line, etc.) characters, too.
text = tp.extractText()  # remember: UTF-8 encoding!
```

If you want more details, you can determine exactly where on a page a certain string appears:

```
# search for at most 4 page locations with specific contents
res = tp.search('MuPDF', 4)
```

The result res will now be [] or a list of no more than 4 IRect rectangles that contain the string 'MuPDF'.

Classes

The list of python-fitz classes, accessible via the prefix \mathtt{fitz} .

Class	Short Description
Colorspace	Define the color space of a <i>Pixmap</i> .
Device	Target object for rendering or text extraction.
DisplayList	A list containing drawing commands.
Document	Basic class for dealing with files.
Identity	The do-nothing <i>Matrix</i>
IRect	A rectangle (pixel coordinates).
Link	A destination
linkDest	The destination of an outline entry
Matrix	A 3x3 matrix used for transformations.
Outline	Outline element (a.k.a. bookmark).
Page	A document page.
Pixmap	A pixel map (for rendering).
Point	Represents a point in the plane.
Rect	A rectangle (float coordinates).
TextPage	Text content of a page.
TextSheet	A list of text styles used in a page.

Colorspace

Represents the color space of a Pixmap.

Class API

```
class Colorspace
```

```
__init__ (self, colorspace, irect)
```

Constructor

colorspace

A number identifying the colorspace. Currently only RGBA is supported (fitz.CS_RGB).

Type: int

irect

A *IRect* object representing the area of the image.

Type: instance

Device

The different format handlers (pdf, xps, etc.) interpret pages to a "device". These devices are the basis for everything that can be done with a page: rendering, text extraction and searching. The device type is determined by the selected construction method.

Class API

class Device

__init__ (self, object)

Constructor for either a pixel map or a display list device.

object

An object representing one of Pixmap, or DisplayList

Type: instance

_init__ (self, textsheet, textpage)

Constructor for a text page device.

textsheet

A TextSheet object.

Type: instance

textpage

A TextPage object.

Type: instance

DisplayList

DisplayList is a list containing drawing commands (text, images, etc.). The intent is two-fold:

- 1. as a caching-mechanism to reduce parsing of a page
- 2. as a data structure in multi-threading setups, where one thread parses the page and another one renders pages.

A DisplayList is populated with objects from a page by running Page.run() on a Device. Replay the list (once or many times) by invoking the display list's run() function.

Methods

run()	(Re)-run a display list through a device.
-------	---

Class API

class DisplayList

fitz.DisplayList (self)

Create a rendering device for a display list.

When the device is rendering a page it will populate the display list with drawing commands (text, images, etc.). The display list can later be reused to render a page many times without having to re-interpret the page from the document file.

Return type: Device

run (self, dev, ctm, area)

Parameters:

- dev (Device) -- Device obtained from Device
- ctm (*Matrix*) -- Transform matrix to apply to display list contents.
- area (*IRect*) -- Only the part of the contents of the display list visible within this area will be considered when the list is run through the device. This does not imply for tile objects contained in the display list.

Document

This class represents a document and is constructed by fitz.Document(filename). This will also open the document specified as filename. Returns a Document object.

Methods and Attributes

Method / Attribute	Short Description
Document.authenticate()	Decrypts the document
Document.loadPage()	Reads a page
Document.save()	Saves a copy of the document
Document.ToC()	Creates a table of contents
Document.close()	Closes the document
Document.outline	First Outline item
Document.name	filename of document
Document.needsPass	Is document is encrypted?
Document.pageCount	The document's number of pages
Document.metadata	The document's meta data

Class API

class Document

authenticate (password)

Decrypts the document with the string password. If successfull, the document's data can be accessed (e.g. for rendering).

Parameters: password (*string*) -- The password to be used.

Return type: int

Returns: True (1) if decryption with password was successfull, False (0) otherwise.

loadPage (number)

Loads a Page for further processing like rendering, text searching, etc. See the Page object.

Parameters: number (*int*) -- page number, zero-based (0 is the first page of the document).

Return type: Page

save (filename)

Saves a copy of the document under the filename (absolute or relative path specifications). Internally the document may have changed, i.e. if the document has been decrypted before, an unencrypted copy will be saved.

Parameters: filename (*string*) -- The filename to save to. Must be different from the original file name.

ToC ()

Creates a table of contents from the outline entries. This will be a Python list [[level, title, page], [...], ...] or [] if there are no outline entries. Note that the title entries are unicode strings.

Return type: list

close ()

Closes filename thus freeing it for other purposes.

outline

Contains either None or the first *Outline* entry of the document. Can be used as a starting point to walk through all outline items.

Return type: Outline

needsPass

Contains an indicator showing whether the document is encrypted (True (1)) or not (False (0)).

Return type: bool

metadata

Contains the document's meta data as a Python dictionary. Its keys are format, encryption, title, author, subject, keywords, creator, producer, creationDate, modDate. For the most part, these key names in an obvious way correspond to the PDF's "official" meta data fields /Creator, /Producer, /CreationDate, /ModDate, /Title, /Author, /Subject, /Keywords respectively. format contains the PDF format version of the file (e.g. 'PDF 1.4'), encryption contains either None when not encrypted, or a string naming the encryption method used (e.g. 'Standard V4 R4 128-bit RC4'). Note that all other metadata values are encrypted if the value for 'encoding' is not None. All item values are UTF-8 encoded strings (or None), except keywords. If keywords is not None, it contains a Python dictionary specifying the document's keywords (again, as UTF-8 encoded strings). The date fields are strings with the PDF-internal timestamp format "D:<DateTime><TZ>", where <DateTime> is the 12 character ISO date YYYMMDDhhmmss (YYYY - year, MM - month, DD - day, hh - hour, mm - minute, ss - second), and <TZ> is a time zone value (time intervall relative to GMT) containing a sign ('+' or '-'), the hour (hh), and minute ('mm', attention: enclose in apostrophies!). For example, a Venezuelan value might look like D:20150415131602-04'30', which corresponds to the timestamp April 15, 2015, at 1:16:02 pm local time Venezuela.

Return type: dict

name

Contains the filename value with which Document was created. :rtype: dict

pageCount

Contains the number of pages of the document. May return 0 for documents with no pages.

Return type: int

Identity

Identity is just a *Matrix* that performs no action. The default constructor of *Matrix* creates an identity matrix.

IRect

IRect is a rectangular bounding box similar to *Rect*, except that all corner coordinates are integers. IRect is used to specify an area of pixels, e.g. to receive image data during rendering.

Attributes

Attribute	Short Description
IRect.width	Width of the bounding box
IRect.height	Height of the bounding box
IRect.x0	X-coordinate of the top left corner
IRect.y0	Y-coordinate of the top left corner
IRect.x1	X-coordinate of the bottom right corner
IRect.y1	Y-coordinate of the bottom right corner

Class API

class IRect

 $_{\rm init}$ (self, x0=0, y0=0, x1=0, y1=0)

Constructor. The default values will create an empty rectangle. Function Rect.round() creates the smallest IRect containing Rect.

width

Contains the width of the bounding box.

Type: int

height

Contains the height of the bounding box.

Type: int

x0

X-coordinate of the top left corner.

Type: int

у0

Y-coordinate of the top left corner.

Type: int

x1

X-coordinate of the bottom right corner.

Type: int

у1

Y-coordinate of the bottom right corner.

Type: int

Link

Represents a pointer to somewhere (this document, other documents, the internet). Links exist per document page, and they are forward-chained to each other, starting from an initial link which is accessible by the <code>Page.loadLinks()</code> method.

Attributes

Attribute	Short Description
Link.rect	Clickable area in untransformed coordinates.
Link.dest	Kind of link destination.
Link.next	Link to next link

Class API

class Link

rect

The area that can be clicked in untransformed coordinates.

Return type: Rect

dest

Get the kind of link destination. An integer to interpreted as one of the ${\tt FZ_LINK_*}$ values.

Return type: int

next

The next Link or None

Return type: Link

linkDest

Class representing the dest property of an outline entry.

Attributes

Attribute	Short Description
linkDest.dest	Destination
linkDest.fileSpec	File specification (path, filename)
linkDest.flags	Descriptive flags
linkDest.isMap	Is this a MAP?
linkDest.isUri	Is this an URI?
linkDest.kind	Kind of destination
linkDest.lt	Top left coordinates
linkDest.named	Name if named destination
linkDest.newWindow	Name of new window
linkDest.page	Page number
linkDest.rb	Bottom right coordinates
linkDest.uri	URI

Class API

class linkDest

dest

something

Return type: Link

fileSpec

Contains the filename (including any path specifications) this link points to.

Return type: string

flags

The flags is a bitfield consisting of indicators describing the validity and meaning of the different aspects of the destination. As far as possible, link destinations are constructed such that e.g. linkDest.rb can be treated as defining a bounding box, though the validity flags (see LINK_FLAG_* values) indicate which of the values was actually specified in the file. Note that the numerical values for each of the LINK_FLAGs are powers of 2 and thus indicate the position of the bit to be tested. More than one bit can be on / True, so do not test for the value of the integer.

Return type: int

isMap

This flag specifies whether to track the mouse position when the URI is resolved. Default value: False.

Return type: bool

isUri

Specifies whether this destination is an internet resource.

Return type: bool

kind

Indicates the type of this destination, like a place in this document, a URI, a file launch, an action or a place in another file. Look at index entries FZ_LINK_* to see the names and numerical values.

Return type: int

lt

The top left *Point* of the destination.

Return type: Point

named

This destination refers to some named resource of the document (see Adobe PDF documentation).

Return type: int

newWindow

This destination refers to an action that will open a new window.

Return type: bool

page

The page number (in this document) this destination points to.

Return type: int

rb

The bottom right *Point* of this destination.

Return type: Point

uri

The name of the URI this destination points to.

Return type: string

Matrix

Matrix is a row-major 3x3 matrix used for representing transformations of coordinates throughout MuPDF.

Since all points reside in a two-dimensional space, one vector is always a constant unit vector; hence only some elements may vary in a matrix. Below is how the elements map between different representations:

normally represented as [a b c d e f].

Methods

Matrixinit()	Constructor.
Matrix.preRotate()	Perform a rotation
Matrix.preScale()	Perform a scaling
Matrix.preShear()	Perform a shearing

Attributes

Matrix.a	Matrix entry at (1, 1)
Matrix.b	Matrix entry at (1, 2)
Matrix.c	Matrix entry at (2, 1)
Matrix.d	Matrix entry at (2, 2)
Matrix.e	Matrix entry at (3, 1)
Matrix.f	Matrix entry at (3, 2)

Class API

```
class Matrix
```

```
_{init} (self, a=1, b=0, c=0, d=1, e=0, f=0)
  Constructor. The default values will construct an identity matrix.
preRotate (deg)
  Perform a rotation for deg degrees
       Parameters:
                     degree -- The extent of the rotation in degrees.
      Return type:
                      Matrix
prescale ()
  Scale
      Return type:
                      Matrix
preShear ()
  Shear
      Return type:
  Matrix entry at (1, 1), default value 1.
             Type: float
```

b Matrix entry at (1, 2), default value 0.

Type: float

c Matrix entry at (2, 1), default value 0.

Type: float

d Matrix entry at (2, 2), default value 1.

Type: float

Matrix entry at (3, 1), default value 0.

Type: float

Matrix entry at (3, 2), default value 0.

Type: float

Outline

outline is a property of <code>Document</code>. If not <code>None</code>, it stands for the first outline item of the document. Its properties in turn define the characteristics of this item and also point to other outline items in either "horizontal" direction by property <code>.next</code> to the next item of same level, or downwards with property <code>.down</code> to the next item one level lower. The full tree of all outline items for e.g. a conventional table of contents can be recovered by following these "pointers".

Methods and Attributes

Method / Attribute	Short Description
Outline.down	Next item downwards
Outline.next	Next item same level
Outline.dest	Link destination
Outline.title	Title (UTF-8 string)
Outline.saveText()	Prints a conventional table of contents to a file
Outline.saveXML()	Prints an XML-like table of contents to a file

Class API

class Outline

down

The next outline item on the next level down. Is None if the item has no children.

Return type: Outline

next

The next outline item at the same level as this item. Is None if the item is the last one in its level.

Return type: Outline

dest

The destination this entry points to. Can be a place in this or another document, or an internet resource. It can include actions to perform like opening a new window, invoking a javascript or opening another document.

Return type: linkDest

title

The item's title as a UTF-8 string.

Return type: string

saveText ()

The chain of outline items is being processed and printed to a file filename as a conventional table of contents.

Parameters: filename (*string*) -- Name of the file to write to.

saveXML ()

The chain of outline items is being processed and printed to a file filename as an XML-like table of contents.

Parameters: filename (*string*) -- Name of the file to write to.

Page

Page interface, created by **Document.loadPage()**.

Methods and Attributes

Method / Attribute	Short Description
Page.bound()	The Page's rectangle
Page.loadLinks()	Get all the links in a page
Page.run()	Run a page through a device
Page.number	Page number

Class API

class Page

bound ()

Determine the a page's rectangle (before transformation).

Return type: Rect

loadLinks ()

Get all the links in a page.

Return type: list

Returns: A python list of *Link*. An empty list is returned if there's no link in the page.

run (dev, transform)

Run a page through a device.

Parameters:

- dev (Device) -- Device, obtained from one of the Device constructors.
- transform (*Matrix*) -- Transformation to apply to the page. May include for example scaling and rotation, see Matrix.preScale() and Matrix.preRotate(). Set it to *Identity* if no transformation is desired.

number

The page number

Return type: int

Pixmap

Pixmaps represent a set of pixels for a 2 dimensional region. Each pixel consists of n bytes ("components"), plus always an alpha. The data is in premultiplied alpha when rendering, but non-premultiplied for colorspace conversions and rescaling.

Methods and Attributes

Method / Attribute	Short Description
Pixmap.clearWith()	Clears a pixmap (with given value)
Pixmap.writePNG()	Saves a pixmap as a png file
Pixmap.invertIRect()	Invert the pixels of a given bounding box
Pixmap.samples	The components data for all pixels
Pixmap.h	Height of the region in pixels
Pixmap.w	Width of the region in pixels
Pixmap.x	X-coordinate of top-left corner of pixmap
Pixmap.y	Y-coordinate of top-left corner of pixmap
Pixmap.n	Number of components per pixel
Pixmap.xres	Resolution in X-direction
Pixmap.yres	Resolution in Y-direction
Pixmap.interpolate	Interpolation method indicator

Class API

class Pixmap

clearWith (self, value=0)

Clears a pixmap.

Parameters: value (int) -- Values in the range 0 to 255 are valid. Each color byte of each pixel will be

set to this value, while alpha will always be set to 255 (non-transparent). Default is 0.

samples

The color and transparency values for all pixels. Samples is a memory area of size width * height * n bytes. The first n bytes are components 0 to n-1 for the pixel at point (x,y). Each successive n bytes gives another pixel in scanline order. Subsequent scanlines follow each other with no padding. E.g. for an RGBA colorspace this means, samples is a bytearray like . . . , R, G, B, A, . . . , and the four byte values R, G, B, A describe one pixel (RGBA is the only supported colorspace at this time).

Return type: bytearray

w

The width of the region in pixels.

Return type: int

h

The height of the region in pixels.

Return type: int

x

X-coordinate of top-left corner

Return type: int

У

Y-coordinate of top-left corner

Return type: int

n

Number of components per pixel

Return type: int

xres

Horizontal resolution

Return type: int

yres

Vertical resolution

Return type: int

invertIRect (self, irect)

Invert all pixels in IRect. All components except alpha are inverted.

Parameters: irect -- Invert all the pixels in the irect. If not given, the whole pixmap will be inverted.

writePNG (self, filename, savealpha=False)

Save a pixmap as a png.

Parameters:

- filename (string) -- The filename to save as (including extension).
- savealpha (bool) -- Save alpha or not.

interpolate

A boolean flag set to True if the image will be drawn using linear interpolation, or set to False if image is created using nearest neighbour sampling.

Return type: bool

Point

Methods

Pointinit()	Constructor.
-------------	--------------

Attributes

Point.x	The X- coordinate.
Point.y	The Y- coordinate.

Class API

class Point

```
__init__ (self, x=0, y=0)
Constructor, defaulting to "top left".
```

 \mathbf{x}

Type: float

У

Type: float

Rect

Rect represents a rectangle defined by its top left and its bottom right *Point* objects, in coordinates: ((x0, y0), (x1, y1)).

Rectangles are always aligned with the respective X- and Y-axes. If $x0 \le x1$ and $y0 \le y1$ is true, the rectangle is called "finite", else "infinite".

Methods

Rect.round()	creates the smallest IRect containing Rect
Rect.transform()	transform Rect with a Matrix

Attributes

Rect.height	Rect height
Rect.width	Rect width
Rect.x0	Top left corner's X-coordinat
Rect.y0	Top left corner's Y-coordinate
Rect.x1	Bottom right corner's X-coordinate
Rect.y1	Bottom right corner's Y-coordinate

Class API

class Rect

 $_$ init $_$ (self, x0=0, y0=0, x1=0, y1=0)

Constructor. The default values will create an empty rectangle.

round ()

Creates the smallest IRect that contains Rect.

Return type: IRect

transform

Transforms Rect with a Matrix.

Return type: Rect

width

Contains the width of the rectangle.

Return type: float

height

Contains the height of the rectangle.

Return type: float

x0

X-coordinate of the top left corner.

Type: float

v0

Y-coordinate of the top left corner.

Type: float

x1

X-coordinate of the bottom right corner.

Type: float

y1

Y-coordinate of the bottom right corner.

Type: float

TextPage

TextPage contains the text of a page.

Methods

TextPage.extractText()	Extract the page's text.
TextPage.search()	Search for a string in the page.

Class API

class TextPage

extractText (self)

Extract the text from a TextPage object. Returns a UTF-8 encoded string of the page's complete text.

Return type: string

search (self, string, maxhit)

Search for the string string.

Parameters:

• **string** (*string*) -- The string to search for.

• maxhit (int) -- Maximum number of expected hits (default 16).

Return type: list

Returns: A python list. Each element of the list is an IRect (without transformation) surrounding a

found string occurrence (or an empty list).

TextSheet

TextSheet contains a list of distinct text styles used on a page (or a series of pages).

Constants and Enumerations

Constants and enumerations of MuPDF as implemented by python-fitz. If your import statement was import fitz then each of the following variables var is accessible as fitz.var

Constants

Constant	Description
	1 - Type of Colorspace is RGBA
CS_RGB	
	'1.7.0' - Version of python-fitz
VersionBind	
	'1.7a' - Version of MuPDF
VersionFitz	

Enumerations

Possible values of linkDest.kind (link destination type).

Value	Description
	0 - No destination
FZ_LINK_NONE	
	1 - Points to a place in this document
FZ_LINK_GOTO	
	2 - Points to an URI
FZ_LINK_URI	
	3 - Launches (opens) a file
FZ_LINK_LAUNCH	
	4 - Performs some action
FZ_LINK_NAMED	
	5 - Points to a place in another document
FZ_LINK_GOTOR	

Possible values of linkDest.flags (link destination flags). Attention: This is a one-byte bit field. The values represent boolean indicators showing whether the corresponding bit is ON.

Value	Description
	1 (bit 0) Top left x value is valid
LINK_FLAG_L_VALID	
	2 (bit 1) Top left y value is valid
LINK_FLAG_T_VALID	
	4 (bit 2) Bottom right x value is valid
LINK_FLAG_R_VALID	
	8 (bit 3) Bottom right y value is valid
LINK_FLAG_B_VALID	
	16 (bit 4) Horizontal fit
LINK_FLAG_FIT_H	
	32 (bit 5) Vertical fit
LINK_FLAG_FIT_V	
	64 (bit 6) Bottom right x is a zoom figure
LINK_FLAG_R_IS_ZOOM
